

NORDVELOCITY

Master Developer Blueprint & Request for Proposal

Premium Chauffeur + Tours / Events / Experiences Platform

Version	1.0
Owner	NordVelocity
Purpose	Developer quotation, build specification, acceptance and handover
Status	Owner-controlled source of truth

No deviation from this specification without written owner approval.

How to Use This Document

- Send this document to shortlisted developers before requesting a final quotation.
- Require a written response to Section 25, including architecture, assumptions, exclusions, milestone pricing, timeline and recurring costs.
- Do not approve full development until one complete taxi transaction and one complete tour transaction work on staging.
- Use the acceptance criteria and handover sections before releasing final payment.

1. Executive Summary

NordVelocity is to be built as a premium, secure, scalable digital platform combining two clearly separated customer journeys: (1) private chauffeur/transportation and (2) curated tours, events and experiences. The platform must be owner-controlled, mobile-first, SEO-ready, maintainable by future development teams, and designed to expand from Finland into the wider Nordic region.

This is not a theme-customization project. It is a business platform. The developer must design the architecture, data model, admin tools, security controls, booking workflows and handover process so that NordVelocity can operate without permanent dependence on the original developer.

2. Non-Negotiable Ownership and Control

All critical assets must be created under accounts controlled by NordVelocity. The developer receives only the access needed to perform the work.

NordVelocity must own and control:

- Domain and DNS
- Hosting/cloud account
- Source-code repository and complete Git history
- Production and staging environments
- Databases and backups
- Payment accounts and payout configuration
- Mapping/API accounts and keys
- Transactional email/SMS accounts
- Analytics, tag manager and search-console properties
- CDN/WAF/security accounts
- All custom source code, design files and documentation
- Licenses purchased specifically for NordVelocity, where license terms allow transfer/ownership

No critical service may depend permanently on a developer's personal account. No hidden backdoors, undocumented administrator accounts, encrypted/obfuscated business logic, or vendor lock-in are acceptable. Developer access must be removable after handover.

3. Project Architecture

The system must be modular. Taxi/chauffeur, tours/experiences, bookings, payments, customers, content, SEO, notifications and reporting should be separate logical modules connected through documented interfaces.

The architecture must support future replacement or extension of individual modules without rebuilding the entire platform. Business rules must be configurable from the administration area wherever reasonably possible. Prices, vehicles, routes, tour dates, capacities, content and SEO must never require source-code edits for normal operations.

Required environments:

- Local/development
- Staging
- Production

Production changes must follow a controlled deployment process. Direct experimental changes on the live system are prohibited.

4. Technology and Engineering Standards

The developer must propose the technology stack and justify it in writing before implementation. The priority is maintainability, security, performance and availability of skilled developers—not novelty.

Required engineering practices:

- Git version control in a NordVelocity-owned repository
- Protected main/production branch
- Feature branches and reviewed merges
- Environment variables/secrets management; no secrets committed to source control
- Documented database schema and migrations
- Documented APIs and third-party integrations
- Reusable components and modular services
- Server-side validation of security-sensitive and pricing logic
- Structured error handling and logging
- Automated tests for critical business logic
- Dependency inventory with versions and licenses
- Coding standards, linting/formatting and reproducible deployment
- Architecture diagram and data-flow diagram
- README/setup documentation sufficient for another qualified team to continue development

5. World-Class Design Direction

NordVelocity must feel like a premium Scandinavian travel and mobility brand—not a conventional taxi website.

Design principles:

- Scandinavian minimalism: generous space, strong typography, restrained decoration
- Premium, calm and trustworthy rather than flashy
- Near-black, white/off-white and one controlled accent colour
- Avoid excessive gold, gradients, glow effects, stock “luxury” clichés and unnecessary animation
- High-quality editorial imagery with consistent ratios
- Clear visual hierarchy and short decision paths
- WCAG-aware contrast, focus states, keyboard navigation and accessible forms
- Responsive design created mobile-first, not desktop-first

The developer/designer must provide a small design system containing typography, spacing scale, colours, buttons, form fields, cards, navigation, alerts, icons, imagery rules and responsive behaviour.

Homepage hero: premium Nordic/Finnish travel landscape blended naturally with a black metallic luxury vehicle, with no taxi roof sign. The first decision must be two clear CTAs: “Explore Tours” and “Book a Chauffeur.” The headline must represent year-round experiences, not only winter/Arctic tourism.

6. Information Architecture and Separate Customer Journeys

The platform must preserve one NordVelocity brand while keeping the two commercial journeys distinct.

Tour journey:

Home → Tours → Destination/Experience Search → Tour Detail → Date/Guests → Checkout → Confirmation

Chauffeur journey:

Home → Chauffeur → Pickup/Destination/Service → Quote → Vehicle → Checkout → Confirmation

Tour pages may contain a subtle secondary chauffeur cross-sell. Chauffeur pages may contain subtle tour recommendations lower in the page or after booking. Cross-selling must never interrupt or confuse the primary booking flow.

7. Chauffeur / Taxi Platform Requirements

Required booking capabilities:

- Point-to-point journeys
- Pickup and destination autocomplete
- Route/distance calculation using an approved mapping provider
- Distance-based pricing
- Fixed-price routes and airport transfers
- Hourly chauffeur service
- Return journeys
- Vehicle-specific pricing
- Passenger and luggage capacity rules
- Availability controls
- Date/time-based rules
- Location/zone-based rules
- Optional surcharges/discount rules
- Quote summary before payment
- Online payment
- Booking confirmation and status management

Pricing must be server-side and configurable. The owner must be able to change base fares, kilometre rates, fixed routes, hourly rates, vehicle pricing, surcharges and availability without code changes.

Vehicle management must include name, class, photos, passenger capacity, luggage capacity, features, active/inactive state and pricing configuration.

The design must leave room for future driver assignment, corporate accounts, minivans, buses, live tracking and partner/API integrations without requiring a complete rebuild.

8. Tours / Experiences Platform Requirements

The tour system must support 50–100+ products immediately and substantially more later without redesign.

Tour types include:

- Winter experiences
- Northern Lights experiences
- Summer tours

- Festivals
- Concert packages
- Event packages
- Private/VIP experiences
- Multi-day packages
- Future categories

Each tour must be structured data, not a manually designed standalone page. The owner must be able to create, duplicate, edit, publish, unpublish and archive tours without coding.

Tour fields should support, where relevant:

- Title and short summary
- Hero/gallery
- Destination and coordinates/map
- Season
- Experience type
- Travel style (private/group/VIP)
- Duration
- Dates and availability
- Capacity
- Adult/child/group pricing
- Seasonal pricing
- Deposit/partial-payment rules if used
- Highlights
- Full overview
- Itinerary
- Included/excluded items
- Pickup/drop-off
- Transportation
- Accommodation
- Event/concert ticket information
- Meals
- Meeting point
- Cancellation/refund terms
- FAQ
- Reviews
- Related tours
- SEO fields

Empty optional fields must not create empty sections on the public page. One reusable premium tour template must render the data consistently.

9. Tour Taxonomy and SEO Hierarchy

Tours must use scalable taxonomies.

Destination hierarchy example:

Finland → Helsinki / Rovaniemi / Levi / Turku / Tampere

Future: Sweden and Norway

Additional taxonomies:

- Season: Winter, Spring, Summer, Autumn, Year-round
- Experience type: Northern Lights, Festival, Concert, Nature, City, Family, Private, Event, Adventure
- Travel style: Private, Small Group, Group, VIP
- Duration bands

Assigning a destination/category to a tour must automatically make that tour appear on the relevant destination/category landing pages.

Conceptual SEO structure:

- /tours/
- /tours/destinations/rovanimi/
- /tours/experiences/northern-lights/
- /tour/private-northern-lights-rovanimi/
- /chauffeur/
- /chauffeur/airport-transfer/
- /airport-transfer/helsinki-airport/

Exact URL rules must be finalized before launch and kept stable. Filter/sort combinations must not generate uncontrolled indexable duplicate pages.

10. Reusable Tour Detail Template

Every tour must follow a consistent template:

- Hero/gallery
- Tour title
- Destination
- Duration
- Starting price
- Availability
- Primary Book Now CTA
- Overview
- Highlights
- Itinerary
- Included/excluded
- Transportation
- Pickup/drop-off
- Accommodation where applicable
- Event ticket information where applicable
- Meals where applicable

- Map
- Cancellation terms
- FAQ
- Reviews
- Related experiences
- Final booking CTA

The owner enters data; the system maintains the visual design automatically.

11. Admin Dashboard and Owner Operations

The owner must be able to perform routine business operations without a developer.

Dashboard capabilities:

- View upcoming taxi and tour bookings
- Search/filter bookings
- View payment status
- Edit/cancel bookings subject to audit rules
- Process or initiate refunds through the approved payment workflow
- Add/edit/duplicate/archive tours
- Manage dates, capacity and pricing
- Manage destinations/categories
- Add/edit vehicles and capacities
- Change chauffeur pricing rules
- Manage fixed routes
- Manage coupons/promotions
- Manage website pages, menus and policies
- Create/edit/schedule blog posts
- Edit SEO fields
- Manage media and image alt text
- View operational reports
- Export appropriate booking/report data
- Manage staff roles and permissions

All material administrative actions should be logged with user, timestamp and action where practical.

12. Blog and Content Management

A full blogging/content system is required.

Blog features:

- Categories and tags
- Authors
- Featured images
- Draft/review/publish workflow
- Scheduled publishing

- Related articles
- Related tours and chauffeur services
- SEO title/meta/URL fields
- Image alt text
- Article structured data where appropriate
- Internal linking support
- Social preview fields

Content should support destination guides, event/festival guides, seasonal travel content, chauffeur/travel advice and other useful editorial content. The blog is an SEO and authority engine, not a decorative news page.

13. SEO Requirements

SEO must be built into the data model and templates from day one.

Editable SEO controls are required for homepage, tour hub, destination pages, experience categories, individual tours, chauffeur pages, strategic route/airport pages, blog posts and important static pages.

Requirements:

- One editable H1 per primary page
- SEO title and meta description
- Clean, stable slugs
- Canonical controls
- XML sitemap
- Robots/indexation controls
- Breadcrumbs
- Appropriate structured data/schema
- Image alt text
- Open Graph/social preview
- Internal linking
- Proper heading hierarchy
- Destination/category pages capable of unique editorial copy above/below dynamic listings
- Redirect management
- No indexing of staging, checkout, internal search or meaningless filter combinations
- Search Console readiness

SEO success must not be defined by a plugin score alone.

14. Payments, Checkout and Financial Controls

The payment architecture must be proposed and approved before development.

Principles:

- Use a reputable PCI-compliant payment provider such as Stripe
- Raw card data must never be stored on NordVelocity servers
- Support cards and relevant wallet methods where commercially appropriate
- Payment state must be synchronized with booking state

- Prevent accidental duplicate charges
- Handle failed/abandoned payments cleanly
- Support full/partial refunds where business rules permit
- Provide receipts/confirmation
- Support coupons/promotions
- Leave room for future invoice/bank transfer/gift card/payment methods

Taxi and tour engines may have separate internal booking records if technically appropriate, but the customer-facing payment experience, branding and communication must feel coherent.

“Book now, pay later” must not be implemented until the business meaning is explicitly defined: reservation without payment, deposit/balance, or a third-party BNPL product.

15. Notifications and Transactional Communication

Required notification flows include:

- Booking received
- Payment received
- Booking confirmed
- Booking changed
- Booking cancelled
- Payment failed
- Relevant pre-service reminder(s)
- Admin alerts for important booking/payment events

Email delivery must use a reliable transactional service rather than depending only on basic server mail. Templates should be branded and editable where practical. Communication logs should be retained according to the privacy/retention policy. SMS may be added later through a documented provider integration.

16. Analytics and Conversion Measurement

Configure analytics so NordVelocity can measure business outcomes, not only page views.

Track events such as:

- Explore Tours CTA
- Book Chauffeur CTA
- Tour search/filter
- Tour detail view
- Tour booking started
- Tour checkout started
- Tour booking completed
- Taxi quote started
- Taxi quote generated
- Vehicle selected
- Taxi checkout started
- Taxi booking completed
- Contact/phone actions

Analytics, Search Console and tag-management properties must be owned by NordVelocity. Consent requirements must be respected. The implementation must avoid duplicate events.

17. Security Architecture

Security is a design requirement.

Minimum controls:

- HTTPS everywhere
- Secure headers and modern TLS configuration
- Multi-factor authentication for privileged accounts where supported
- Role-based access and least privilege
- Strong password policy
- Protection against common web vulnerabilities (OWASP Top 10)
- Server-side validation and authorization
- CSRF protection
- Secure session/cookie settings
- Rate limiting for sensitive endpoints
- Bot/spam protection appropriate to forms and authentication
- Secrets stored outside source code
- Restricted API keys
- Encryption in transit and appropriate encryption at rest
- Dependency/security update process
- Centralized error/security logging
- Audit logs for critical admin actions
- WAF/CDN protection where appropriate
- Regular vulnerability review
- No production debug information exposed to customers

A pre-launch security review is required. High/critical findings must be resolved before launch.

18. Privacy, Data Governance and EU Readiness

The system must be designed for EU privacy requirements.

Technical capabilities should support:

- Privacy notice and cookie/consent management
- Data minimization
- Configurable retention periods
- Export/access requests
- Deletion/anonymization workflows where legally appropriate
- Consent logging where consent is relied upon
- Separation of operational communications from optional marketing consent
- Vendor/subprocessor inventory
- Secure handling of customer personal data

Legal wording and regulatory interpretation must be confirmed by qualified legal/compliance professionals. Packages combining transport, accommodation, event tickets or other travel services must be reviewed for applicable Finnish/EU package-travel obligations before sale.

19. Performance and Reliability

Performance is part of the premium experience.

Requirements:

- Responsive images and modern formats (WebP/AVIF where appropriate)
- Lazy loading below the fold
- CDN/caching strategy
- Optimized fonts
- Minimal unnecessary JavaScript
- No unnecessary heavy animation
- Database indexing and query optimization
- Background jobs/queues for slow tasks where appropriate
- Monitoring for uptime, errors and performance
- Core Web Vitals testing on representative mobile devices
- Load/performance testing of critical booking endpoints before launch

The developer must define measurable performance targets after hosting/architecture selection rather than promising an arbitrary universal page-load number.

20. Backup, Disaster Recovery and Business Continuity

Required:

- Automated database and file backups
- Off-site backup copy
- Documented retention policy
- Encrypted backups where appropriate
- Restore procedure
- At least one verified restore test before handover
- Recovery Point Objective (RPO) and Recovery Time Objective (RTO) proposed by developer and approved by owner
- Rollback plan for deployments
- Incident contact/escalation procedure

A backup that has never been restored is not considered verified.

21. Testing and Quality Assurance

Before launch, the developer must complete and document:

- Unit tests for critical business logic
- Integration tests for booking/payment/map/email integrations
- End-to-end tests for taxi and tour bookings
- Mobile/tablet/desktop responsive testing
- Browser testing

- Accessibility review
- SEO technical review
- Security review
- Performance review
- Backup/restore test
- Payment success/failure/refund tests
- Capacity/overbooking tests
- Email delivery tests
- Fixed-route and distance-pricing tests
- Role/permission tests

Minimum real-world chauffeur routes should include short, medium, long, fixed-price and return journeys. Tour tests should include single/multiple guests, capacity reached, sold-out dates, pricing variations and cancellation/refund flows.

22. Development and Approval Process

Required delivery sequence:

1. Discovery and requirements confirmation
2. Proposed architecture and technology stack
3. Data model and architecture diagrams
4. Staging environment
5. Design system and homepage mockup
6. Working taxi prototype
7. Working tour prototype
8. Payment proof of concept
9. Owner approval
10. Reusable templates/components
11. Full implementation
12. Content/SEO structure
13. QA/security/performance testing
14. Owner acceptance testing
15. Production launch
16. Monitoring and warranty period
17. Final documentation/training/handover

Do not mass-produce pages before one complete taxi transaction and one complete tour transaction work correctly on staging.

23. Acceptance Criteria

The project is not complete until NordVelocity can answer YES to the following:

- Can a customer obtain an accurate taxi quote?
- Do distance and fixed-route pricing work correctly?
- Can vehicle capacity/pricing be managed without code?

- Can customers book/pay on mobile?
- Can customers search/filter tours?
- Does capacity prevent tour overbooking?
- Can the owner create the 51st or 101st tour without developer assistance?
- Does a new tour automatically appear in assigned destination/category listings?
- Can SEO fields be edited without code?
- Are blog posts fully manageable by the owner?
- Are taxi and tour journeys distinct but visually one brand?
- Are payment and notification flows working?
- Are analytics events validated?
- Has backup restore been demonstrated?
- Are staging and safe deployment available?
- Are all critical accounts/assets controlled by NordVelocity?
- Can another qualified developer continue the project using the documentation?

24. Documentation, Training and Final Handover

Before final payment, deliver:

- Complete source code and Git history
- Database schema/migrations
- Architecture and data-flow diagrams
- Environment/configuration documentation
- Deployment and rollback guide
- Backup/restore guide
- Security/operations guide
- API/integration documentation
- Dependency/license inventory
- Admin user manual
- Owner training session(s)
- Video or step-by-step guides for common tasks
- Instructions for adding/duplicating tours
- Pricing/date/capacity management instructions
- Vehicle and chauffeur-pricing instructions
- Booking/refund management instructions
- Blog/SEO instructions
- Analytics access and event documentation
- Credentials/account inventory (transferred securely, not placed in the public document)
- Warranty/support terms
- Developer access-removal checklist

Final payment should be tied to successful acceptance testing and complete handover, not merely visual completion.

25. Developer Proposal / RFP Response Required

Before hiring, ask the developer to respond in writing to each item below:

1. Proposed architecture and technology stack, with reasons.
2. Which parts will be custom-built versus third-party services/libraries.
3. How taxi route calculation and pricing will work.
4. How tour inventory, dates, capacity and pricing will work.
5. How the owner will add the 51st/101st tour without coding.
6. Payment architecture and refund handling.
7. Security approach and how OWASP risks will be addressed.
8. Hosting/cloud recommendation and estimated recurring infrastructure cost.
9. Backup/disaster-recovery approach.
10. SEO/taxonomy implementation.
11. Analytics/conversion tracking approach.
12. Accessibility and performance approach.
13. Testing plan.
14. Data migration/content-entry assumptions.
15. Exact project deliverables.
16. Estimated timeline by milestone.
17. Fixed price or detailed cost range by milestone.
18. Third-party recurring costs and licenses.
19. Warranty period and what qualifies as a bug.
20. Post-launch support rates/SLA.
21. Examples of comparable booking/e-commerce/travel systems.
22. Who will work on the project and their roles.
23. Confirmation that all custom source code and project assets will be handed over to NordVelocity.
24. Confirmation that no critical system will remain under the developer's personal account.
25. Confirmation that another qualified developer can take over after handover.

The proposal should identify assumptions, exclusions, risks and dependencies. A single lump-sum number without architecture, scope and assumptions is not sufficient.

26. Recommended Commercial Milestones

A suggested payment structure should be negotiated around verified deliverables, for example:

- Milestone 1: discovery, architecture, UX direction
- Milestone 2: working taxi prototype
- Milestone 3: working tour prototype and admin workflow
- Milestone 4: payment, notifications and core integrations
- Milestone 5: full UI/content/SEO implementation
- Milestone 6: QA, security, performance and owner acceptance
- Milestone 7: launch, documentation, training and final handover

Keep a meaningful final retention until acceptance criteria, documentation and handover are complete. Exact percentages should be negotiated in the contract.

27. Final Objective

NordVelocity must emerge as one premium Nordic mobility and travel brand with two specialized conversion journeys:

PRIVATE CHAUFFEUR / TRANSPORTATION

and

CURATED TOURS / EVENTS / EXPERIENCES

The customer should understand the choice immediately, complete a booking with minimal friction, trust the payment and service process, and discover the other side of the business without confusion.

The owner must be able to operate, grow and transfer the platform independently. The platform should be designed so future developers extend it—not rebuild it.

Owner Note

The accompanying DOCX contains the Bengali owner summary. The PDF is optimized as the developer-facing English master specification.
